Introduction

What's **Phylogenetic Analysis**?

Introduction

Phylogenetic Analysis is a field of biomedical research which allow to understand the evolution of bacterial and viral epidemics.

Phylogenetic Analysis

PhyloDB

Graph-Oriented
Database

Problem

- **No future support** for frameworks used by PHYLOViZ Desktop
- Features in both versions of PHYLOViZ are **not the same**
- PHYLOViZ Online is **not modular**, which makes it difficult to extend and maintain
- Current solutions **do not scale** for large data analysis and visualization
- Results and optimizations are not stored for reuse

Solution: PHYLOViZ Web Platform

**Modular
Architecture**

Web Based

**Advanced Data
Management**

**Data Centric
Workflows**

Why Modular?

Allows seamless integration of new modules/tools, creating/editing **workflows**

Customization of **data repositories**, providing flexibility in storing and managing phylogenetic data

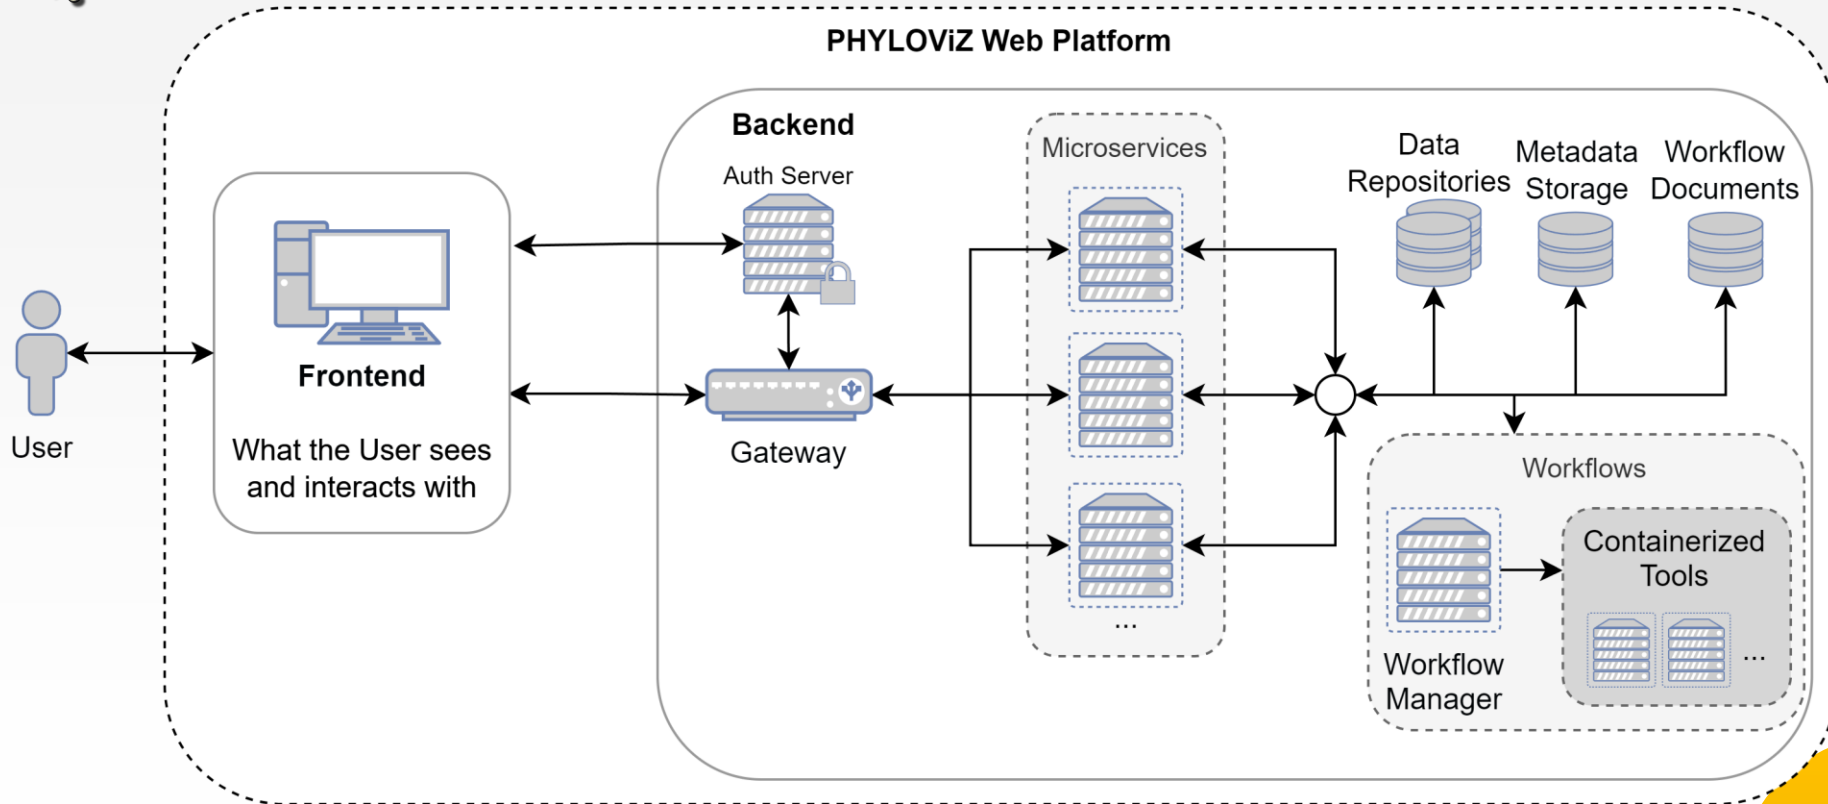

03

Architecture

Data Model

Phylogenetic Data

PhyloDB

Model and Database used for first deployment. Uses the graph database **neo4j**.

OpenStack S3

Object storage of OpenStack used for file storage.

Others

Other repositories can be easily used, even at the same time, because of **metadata storage**.

Data Model

Metadata

MongoDB

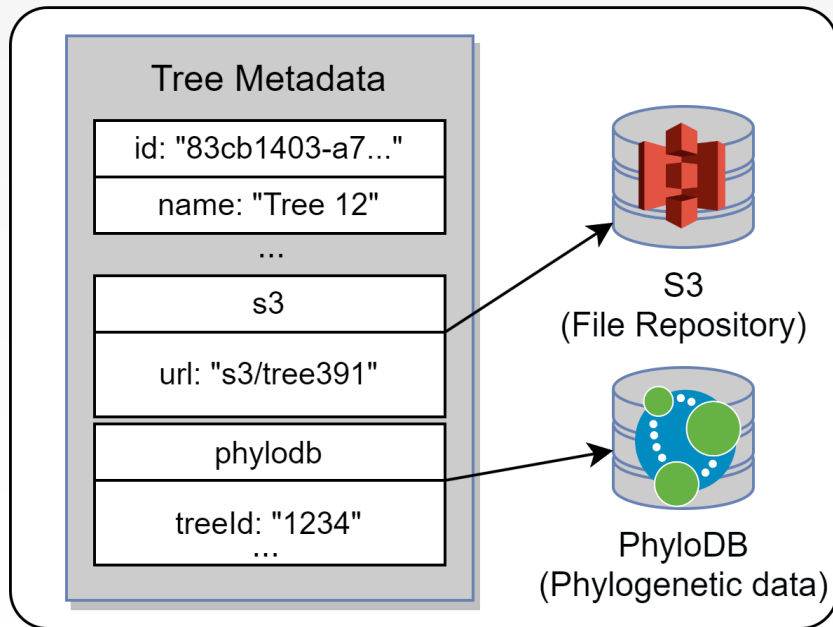

- **Abstraction** between application and data repositories.
- Document in MongoDB.
- Stores **information of each resource** – no need to change existing databases to fit the data model of our application.
- Stores **access information** for each data repository – multiple data representations.

Data Model

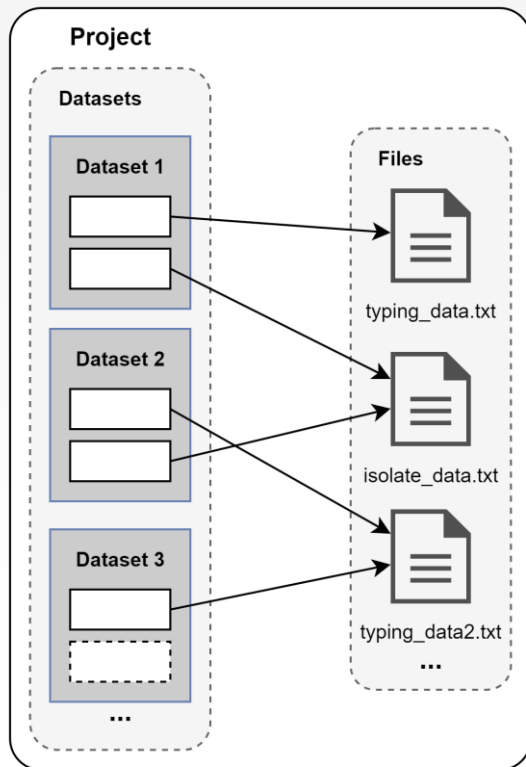

Multiple data representations

- Integration with **multiple** data repositories
- Different data representations to be used in different operations – **flexibility**.
- Data **replicated** across the repositories.

Workflows

- **Workflow** and **tool templates** are managed by the **system administrator** and stored in a document database.
- Ideally tool images are previously uploaded to the custom **Docker image registry**.
- Workflows and tools can be added, edited and removed during **runtime**.

← Workflow Docker Volume

Tree Visualization

- Cosmos (cosmograph) used as a base, to provide the **force directed layout**, showing the tree as a graph and running the **simulation**.
- Cosmos uses **WebGL** to run the simulation on the **GPU**, making use of its **parallel computation capabilities**.

Cosmos

Several additions to cosmos were made:

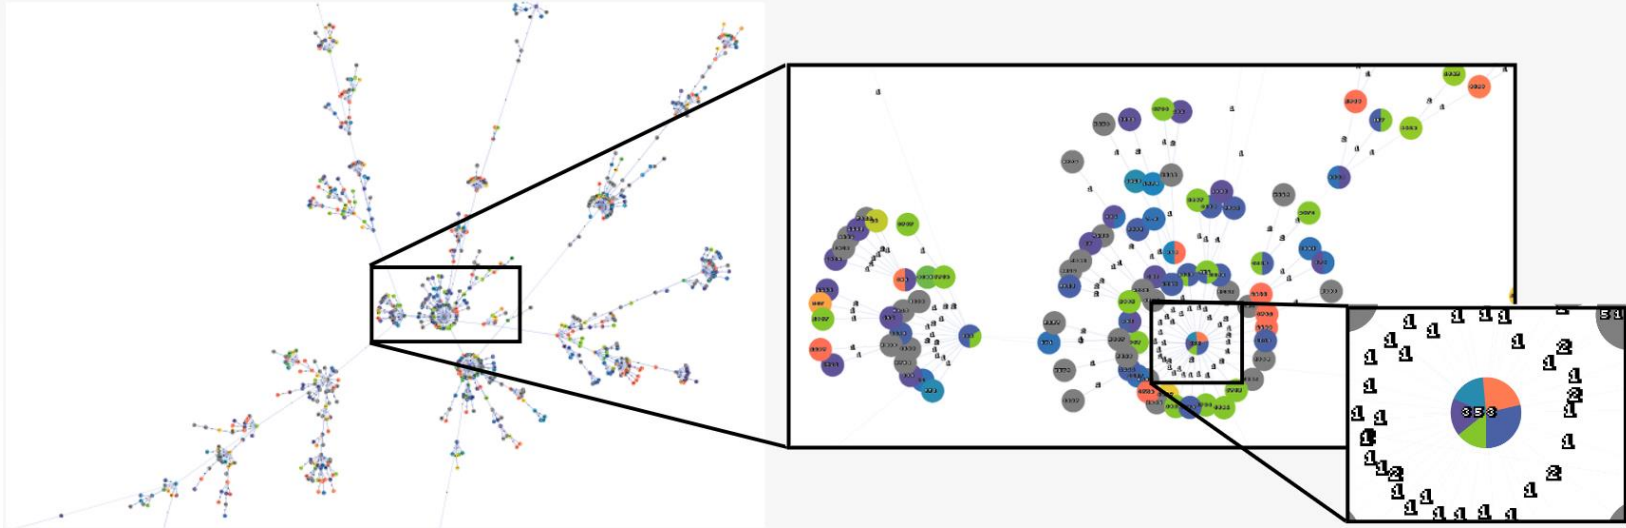

- **Labels** on nodes and edges;
- **Draggable** nodes;
- **Pie-charts** on nodes to represent ancillary data from isolates.

Tree Visualization

- High scalability, up to **15000 nodes** per cluster visualization.
- Such scalability is not possible in PHYLOViZ Online.

Deployment

- Deployed at [**web.phyloviz.net**](https://web.phyloviz.net)
- Authentication at [**auth.phyloviz.net**](https://auth.phyloviz.net)
- Infrastructure **Biodata**, within private clouds hosted by Instituto Superior Técnico, using **OpenStack**
- **Two VMs**: one for Apache Airflow and other for the platform itself

Testing

Testing

- **Manual Testing:** Service mocks in the frontend and Postman for API testing
- **Automatic Testing:** Unitary tests and Integration Tests
- **User Acceptance Testing:** to be conducted by a dedicated team from Institute of Molecular Medicine (iMM), in the future

07

Demonstration

08

Conclusion

Conclusions

- The PHYLOViZ Web Platform is a **modular** and **extensible** tool for phylogenetic analysis.
- It supports large-scale analyses through parallel computations on **cloud** and HPC environments.
- The platform integrates existing tools and provides **efficient data management** and analysis capabilities.
- It offers a **user-friendly interface** and advanced features for phylogenetic analysis.

Future Work

- Enhanced Visualization, including Collapsible Tree Visualization
- Dynamic Workflows
- Community Engagement and Collaboration
- Integration with PubMLST or other databases
